Excerpt: . . . a point source but a property of the medium. Transmission loss is a general term representing the sum of spreading, attenuation, and refraction losses (Urick, 1983). Spreading refers to the weakening of sound as it travels away from a source. With respect to ambient noise, it pertains to that portion of the noise field measured at a distance from one or more of the components such as seismic events, storms, shipping or biologics. Spreading is quantified as a function of geometry with respect to the source. In deep water or within the surface bottom boundaries of a body of water (referred to as one water-depth) the sound will radiate from the source in all directions as a sphere. This is known as spherical spreading and the rate of decay...
